Chapter 1: The History of Money

Bartering to Banknotes to Bitcoin

How money has changed over 5,000-plus years

Introduction

The terms "money" and "currency" are often used interchangeably. However, several theories suggest they are not identical. According to some theories, money is inherently an intangible concept. Currency, on the other hand, is the physical or tangible manifestation of the intangible concept of money.

According to this theory, money cannot be touched or smelled. Currency is the coin, note, object, or physical representation that is presented in the form of money.

The basic form of money is numbers while the basic form of currency is paper, banknotes, coins, or plastic cards like credit or debit cards. Though this distinction between money and currency is important in some contexts, for the purpose of this examination of the history of money, the terms are used interchangeably.

KEY TAKEAWAYS

- Money is a medium of exchange with a recognized value that was adopted to make it easier for people to trade products and services with one another.
- The history of money crisscrosses the world as various cultures recognize the need to simplify trade by introducing a single, portable token of value into the process.

- People bartered before the world began using money.
- The world's oldest known coin minting site was located in China, which began striking spade coins sometime around 640 BCE. Since then, the world has adopted banknotes and moved into digital forms of payment, including virtual currencies.

What Is Money?

Money doesn't always have value, whether it's represented by a seashell, a metal coin, a piece of paper, or a string of code mined electronically by a computer. With global wealth estimated to be about \$432 trillion at the end of 2023, the value of money depends on the importance that people place on it as a medium of exchange, a unit of measurement, and a storehouse for wealth.

Money allows people to trade goods and services indirectly. It helps communicate the price and value of goods and provides individuals with a way to store their wealth. It is valuable as a unit of account—a socially accepted standard by which things are priced and with which payment is accepted. However, both the usage and form of money have evolved throughout history.

From Bartering to Currency

Money has been part of human history for at least the past 5,000 years in some form or another. Before that time, historians generally agreed that a system of bartering was likely used. Bartering is a direct trade of goods and services.

For example, a farmer may exchange a bushel of wheat for a pair of shoes from a shoemaker. However, these arrangements take time.

A type of currency slowly developed over the centuries that involved easily traded items like animal skins, salt, and weapons. These traded goods served as the medium of exchange even though the value of each of these items was still negotiable in many cases. This system of trading is spread across the world and still survives today in some parts of the globe.

One of the greatest achievements of the introduction of money was the increased speed at which business, whether it involved mammoth slaying or monument-building, could be done.

In early August 2021, Chinese archaeologists with the State University of Zhengzhou announced the discovery of the world's oldest known, securely dated, coin minting site in Guanzhuang in Henan Province, China. A mint is a facility where currency is created. Sometime around 640 BCE, this facility began striking spade coins, one of the first standardized forms of metal coinage.

First Official Currency Is Minted

Meanwhile, farther west during this era, in 600 BCE, metal coinage was invented when Lydia's King Alyattes minted what is believed to be the first official currency,

the Lydian stater.

The coins were made from electrum, a mixture of silver and gold that occurs naturally, and the coins were stamped with images that acted as denominations.

Lydia's currency helped the country increase both its internal and external trading systems, making it one of the richest empires in Asia Minor. Today, when someone says, "as rich as Croesus," they are referring to the last Lydian king who minted the first gold coin.

Transition to Paper Currency

During 1260 CE, the Yuan dynasty of China moved from coins to paper money. By the time Marco Polo, a Venetian merchant, explorer, and writer who traveled through Asia along the Silk Road, visited China in approximately 1271 CE, the emperor of China had a good handle on both the money supply and its various denominations.

In fact, in the place where modern American bills say, "In God We Trust," the Chinese inscription at that time warned: "Those who are counterfeiting will be beheaded."

Parts of Europe still used metal coins as their sole form of currency until the 16th century. Colonial acquisitions of new territories via European conquest provided new sources of precious metals and enabled European nations to keep minting a greater quantity of coins.

But banks eventually started using paper banknotes for depositors and borrowers to carry around in place of metal coins. These notes could be taken to the bank at any time and exchanged for their face value in metal, usually silver or gold coins.

This paper money could be used to buy goods and services. In this way, it operated much like currency does today in the modern world. However, it was issued by banks and private institutions rather than the government, which is now responsible for issuing currency in most countries.

IMPORTANT

The gold standard was established in the 1870s. Under this rule, currency printing was permitted based on the amount of gold a country had in its reserves.

The first paper currency issued by European governments was actually issued by their colonial governments in North America. Because shipments between Europe and the North American colonies took a long time, colonies often ran out of cash.

The first instance was in Canada (then a French colony) in 1685 when soldiers were issued playing cards denominated and signed by the governor to use as cash instead of coins from France.

The Emergence of Currency Wars

The shift to paper money in Europe increased the amount of international trade that could occur. Banks and the ruling classes started buying currencies from other nations and created the first currency market.

The stability of a particular monarchy or government affected the value of the country's currency, and thus, that country's ability to trade on an increasingly international currency market.

The competition between countries often led to currency wars, where competing countries would try to change the value of the competitor's currency by driving it up and making the enemy's goods too expensive, by driving it down and reducing the enemy's buying power (and ability to pay for a war), or by eliminating the currency completely.

Mobile Payments

The 21st century gave rise to a novel form of payment activated with the touch of your finger. Mobile payments refer to money used to pay for goods and services. They can also be used to transfer money to another individual, such as a family member or friend. This can all be done using a portable electronic device, such as a smartphone or tablet device.

This form of payment first came to prominence in Asia and Europe before moving over to North America. From payments via text message, the technology evolved to allow cheques to be deposited using the camera app on smart devices.

Virtual Currency

Virtual currencies are only available in electronic form. As digital representations of money, this type of currency is stored and traded using computer applications or specially designated software. The appeal of virtual currency is that it offers the promise of lower transaction fees than traditional online payment mechanisms do and is operated by decentralized authorities, unlike government-issued currencies.

Bitcoin quickly became the standard for virtual currencies. It was released in 2009 by the pseudonymous Satoshi Nakamoto. All of the world's Bitcoin was worth \$1.14 trillion as of Aug. 7, 2024.

Keeping in mind, though, that virtual currencies like Bitcoin have no physical coinage because they are traded on exchanges.

Ancient transaction forms have been co-opted: for example, bartering still occurs on the margins in some markets such as the business-to-business (B2B) space and some consumer services. The monetary system will surely continue evolving as long as humans require a medium of exchange.

EVOLUTION OF MONEY

INTRODUCTION

There are three basic needs -food, clothing and shelter. These are essential for both men and women. In early ancient times, these needs were fulfilled but in vain through barter system. Money came into existence when it was needed. It fulfills needs easily but how it transformed into a credit card, that we need to know. There are five stages of evolution – Commodity Money (Goods), Metallic Money (Coins), Paper Money (Bank Notes), Credit Money (Cheques & DDs) and Plastic Money (Credit & Debit Cards).

1. COMMODITY MONEY

Money is a common thing used in exchange for purchasing goods and services. In ancient times, barter system was mostly prevailed in the world. This system started creating difficulties in trade as barter trade couldn't be done between two individuals if one has need for something that another have but the latter individual has no need of something that form Eris offering.

For eg: There are two farmers named A and B. A is growing wheat and B is growing rice. A needs rice and he is offering wheat to B but B has no need of wheat which is offered by A and, that's why, B didn't accept the offer given by A. So, there cannot be exchange between A and B. Thus, common things like shells, pebbles, salt, came into existence as common goods used for exchange. Now A can sell his wheat to C and, in return, he gets shells as money and, with this, he can buy rice from B and thus, his needs could be fulfilled easily through money. This was the birth of money and where ancient economy started to develop.

2. METALLIC GOODS

As people started using commodity as a money, new problems came into being. Commodity money had three common defects - perishability, indivisibility and heterogeneity. They were perishable so they couldn't be kept for a long time and so, people couldn't repay their loans or they couldn't save it for future needs. It was hardly divisible as commodities like cows, salt, etc are useless if divided. So, it was difficult to buy a product in a value which is half of currency's value. Different commodities were used in different markets or cities as a currency, that's why, intercity trade was almost impossible. For eg: A lives in city X and B lives in city Y. A cannot trade with B because the city X accepts shells for currency and city Y accepts cattle as a currency. So, ancient civilizations devised metallic money to solve these problems.

Metallic money was durable - it can be saved for a long time and can be used for future repayments or can be saved for future needs. People of ancient civilizations manufactured coins in different metals to indicate different values - gold coins were used for highest valuable goods and so, it can be divided into smaller values by exchanging gold coin for two silver or three bronze coins which have value smaller than gold coin. Coins were acceptable in more than one city, so A can trade with B as cities X and Y have accepted same metallic currency system.

3. PAPER MONEY

As people started using metallic money, it was hardly portable. As trade and commerce increased, people started becoming rich but it was virtually impossible to possess vast amount of coins as they were very heavy and bulky. So, during early medieval time in far east, people started developing paper money as paper is a material lighter than coins and so they could be carried easily from one place to another and the speed of trade would increase. Now, people were able to possess (somewhat) vast amount of money.

4. CREDIT MONEY

As money became the household's main needs and greed overtook relationship in its importance, life was not safe and money had no protection from theft. To solve this, a banking system was developed. Through this system, people can save their earning in a given account and can ask for loans for their needs. As money lenders normally exploit poor people, bank took the responsibility to provide loans without having danger in their life. It is a systematic institution from which people can purchase goods or services by transferring money from their account to the seller's account easily by using an instrument named cheque. Any amount of money, high or low, can be transferred through cheque by writing that amount of money on it. Also, many governments have their own bank for saving and protecting public money and this led to control of flow of money in a country's economy. And thus, banking became the backbone of household as well as national economy.

5. PLASTIC MONEY

When digitization of information & data process started, banks took advantage and digitized their accounts. Also, the age of computer and internet created a favourable atmosphere for creating plastic money. Plastic Monies are of two types – credit card and debit card. ATM started to develop and plastic money could be converted in cash through this machine. Plastic monies are swiped for transaction and nothing but transaction could be done. It has become a symbol of modernity. Modern shops asks for credit card except from people who don't have it. Only bank balance could be transferred and not plastic card itself. It is portable, durable and divisible

Chapter 3: Budgeting

Introduction

Budgeting helps you manage your money better. It's about knowing how much money you have, what you spend it on, and how you can save for the future. By budgeting, you can plan for important goals like buying something special, saving for school, or even helping our families. Let's learn how to do this step by step!

Cash Inflows and Cash Outflows

Cash Inflows (Income): Sources and Management

Income refers to the money received by individuals or households, typically as compensation for work, investments, or other sources. Understanding the various sources of income is essential for effective financial planning.

The primary sources of income include earned income (salaries, wages, bonuses, commissions), unearned income (interest, dividends, rental income), and other forms such as government assistance or gifts.

Effective management of income begins with assessing the total amount received. This includes not only regular salary but also any supplementary income, such as part-time jobs, freelance work, or side businesses. By determining the total income, individuals can establish a clear picture of their financial situation and how much money is available for budgeting purposes.

It is important to differentiate between gross income (the total earnings before taxes and deductions) and net income (the amount received after taxes and other deductions). Net income is crucial for budgeting since it represents the actual amount of money available for spending and saving. Understanding the nuances of income management is vital for individuals to make informed financial decisions and set realistic financial goals.

Cash Outflows (Expenses): Tracking and Categorizing

Expenses are the costs incurred for goods and services consumed, and they can be broadly categorized into fixed and variable expenses. Fixed expenses are those that remain relatively constant from month to month, such as rent or mortgage payments, insurance premiums, and loan repayments. In contrast, variable expenses fluctuate based on consumption and can include groceries, entertainment, and dining out.

Tracking expenses is a crucial step in understanding one's spending habits and identifying areas where adjustments can be made. By keeping a detailed record of expenditures over a specific period, individuals can gain insights into their spending patterns. Various tools can assist in tracking expenses, including mobile apps, spreadsheets, or even pen-and-paper methods.

Categorizing expenses allows individuals to assess their financial priorities and determine where to allocate funds. For instance, essential expenses such as housing, utilities, and transportation should take precedence over discretionary spending on entertainment or luxury items. By understanding the different categories of expenses, individuals can develop a more structured approach to managing their finances.

Types of Expenses

1. Fixed Expenses:

These are expenses that you pay for every month, like school fees, rent, or subscriptions. They don't change much.

2. Variable Expenses:

These are expenses that change every month, like snacks, clothes, or outings. You can try to spend less on these.

How to Manage Expenses:

- Write down all expenses to see where your money goes.
- Look for ways to save. For example, instead of buying snacks every day, you could bring homemade treats!

Factors Affecting Cash Flows

Cash flow is the amount of cash and cash-equivalents that move in and out of a business. Many factors can affect cash flow, including:

- **Receivables and payables:** How much money is coming in and going out of the business:
 - ★ **Accounts receivable:** The amount of money owed to the business by customers and other debtors.
 - ★ **Accounts payable:** The amount of money owed by the business to suppliers and other creditors.
 - ★ **Days payable outstanding:** How quickly a business pays its suppliers.
- **Inventory:** Too much inventory can tie up funds that could be used elsewhere.
- **Credit policy:** Whether to grant credit to customers or not.
- **Cash discounts:** Can encourage customers to pay more quickly.
- **Investing and financing:** Investment decisions, such as purchasing real estate or equipment, can decrease cash flow.
- **Average collection period:** How long it takes to convert sales into cash.
- **Accounts receivable to sales ratio:** The ratio of accounts receivable to monthly sales.
- **Social factors:** How the demographics and social norms of the target market impact the business.
- **Income versus expenses:** Cash in versus cash out, both today and forecasted over the next six months.

What is Budgeting?

What does “budgeting” mean?

A budget is like a plan for your money. It shows how much you earn (called “income”) and where you spend it (called “expenses”). A budget helps you save money and avoid spending too much.
